Leak Seeker® Leak Detection Powder

“We Take The Dust Out of Industry!®”

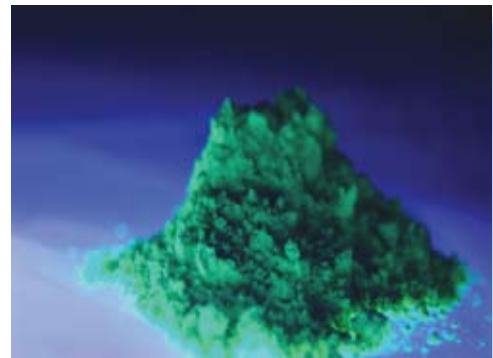

Midwesco Knows How to Find Your Leaks!

Utilizing Midwesco's Leak Seeker® system as part of your regular baghouse maintenance program can help you avoid costly unscheduled shutdowns, and achieve top efficiency and performance for your baghouse/dust collector. Our Leak Seeker® powders offer a low cost, effective way of locating broken filter bags, cracked tube sheets, faulty seals or just for preventive maintenance use.

The Leak Seeker® system contains an illuminating light and tracing powder. The fluorescent colored powder illuminates when our leak detection lamp is waved across it. To test for leaks, simply introduce the powder into the dirty air stream at a convenient pick-up point on the hopper. Briefly run the fan and the fluorescent powder will quickly pass through the filter bags and tube sheets. Simply, wave the portable Leak Seeker® lamp on the clean air side of the bags or tube sheet and the powder will emit an intense glow . . . thus your defective bags or tube sheet cracks or seals are quickly identified.

Leak Seeker® can be used in all baghouse types with operating temperatures up to 550°F (288°C). It is recommended to keep a second color on hand to insure that all repairs were completed properly.

Our maintenance crews use Leak Seeker® system to insure their work . . . your crews should too! So request a quote or place your order today to start saving both time and money 800.336.7300 or +1.540.667.8500.
